```

2.2 l-r-capacity-maxflow

Maximum flow problem with minimum capacities

We describe how to find the maximum flow from S to T when the edges also constrain the minimum bound of the flow amount (edges have “minimum capacities”). It can be boiled down to an ordinary max-flow problem.

Consider an edge from u to v whose capacity is R and minimum capacity is L . To deal with the minimum capacity, create a new vertex S' to T' , remove the original edge, and add edges with the following capacities:

Flow network example with minimum capacities

Add such edges for all edges with the minimum capacities. On the resulting graph, accumulate maximum flow in the following order:

- from S' to T'
- from S' to T
- from S to T'
- from S to T

An S - T flow that satisfies the minimum capacities exists if and only if, for all outgoing edges from S' and incoming edges to T' , the flow and capacity are equal. (This can be understood by corresponding the flows from S' and T' to the original edges.)

Alternatively, if you just want to know the existence of a flow satisfying the minimum capacities, one can add an edge from T to S with infinite capacity and consider the flow from S' to T' once, instead of accumulating flows four times.

2.3 Венгерский алгоритм

```

pair<int, vector<int>> venger(vector<vector<int>> a) {
    // ищет минимальное по стоимости
    // работает только при n <= m
    // a - массив весов (n+1) x (m+1)
    // a[0][..] = a[..][0] = 0
    // возвращает ans[i] = j если взяли ребро a[i][j]
    int n = (int) a.size() - 1;
    int m = (int) a[0].size() - 1;
    vector<int> u(n + 1), v(m + 1), p(m + 1), way(m + 1);
    for (int i = 1; i <= n; ++i) {
        p[0] = i;
        int j0 = 0;
        vector<int> minv(m + 1, INF);
        vector<char> used(m + 1, false);
